PLANNING & LAYOUT GUIDE

Principles for arranging play equipment so that every product works safely, accessibly and beautifully together. Always combine them with the product data on each catalogue page.

01

Keep the safety zone free

The safety zone (L × W) listed for each product is the whole area to keep clear, including the equipment itself. No fixed obstacles, paths or other equipment may enter it unless the product data allows overlap.

02

Separate age groups

Place toddler equipment apart from equipment for older children, ideally with low planting or a fence between zones, so that different ages do not compete for the same space.

03

Place moving equipment at the edge

Swings, roundabouts, seesaws and spring riders need larger zones in the direction of movement. Position them at the edge of the playground, away from walking routes and quiet areas.

04

Plan the surfacing together with the layout

Impact-attenuating surfacing is chosen by free fall height (WSU) of the highest piece of equipment and must cover the whole safety zone, not only the area under the play item.

05

Think inclusive from the start

Provide a firm, step-free route to the playground and to at least some pieces of equipment. Combine inclusive items with sensory and social play so that all children play side by side.

06

Mind sightlines and circulation

Keep clear supervision lines from seating areas, give entrances room, and avoid dead ends. Orient slides away from direct afternoon sun and put shade and benches near the calm zones.

SAFETY STANDARDS: EN 1176 & EN 1177

NOVARE equipment is offered for public playgrounds designed to the European standards below. This page is an orientation summary; the full standards and local regulations always take precedence.

01

EN 1176 · Playground equipment

The EN 1176 series sets safety requirements and test methods for playground equipment: Part 1 gives the general requirements, further parts cover swings, slides, cableways, carousels, rocking equipment and spatial networks.

02

EN 1177 · Impact-attenuating surfacing

Defines how the critical fall height of a surface is determined. The surfacing must be tested for a critical fall height at least equal to the free fall height of the equipment.

03

Free fall height (WSU)

The greatest vertical distance between the child's body support position and the ground below. EN 1176 limits it to 3 m; above 0.6 m impact-attenuating surfacing is required.

04

Entrapment hazards

Openings between 89 mm and 230 mm are a head and neck entrapment risk and are avoided in design; gaps for fingers are controlled the same way. Never modify gaps or add parts to supplied equipment.

05

Inspection & maintenance

EN 1176-7 describes installation, inspection, maintenance and operation: regular visual checks, operational inspections and an annual main inspection by a competent person.

06

Documentation for your project

Request the installation instructions, safety zone drawings (DWG/PDF) and conformity documents for each item, and keep them in the playground's maintenance file.

HOW TO READ THE PRODUCT TABLES

Dimensions L × W
Footprint of the equipment in metres

Height
Overall height of the equipment

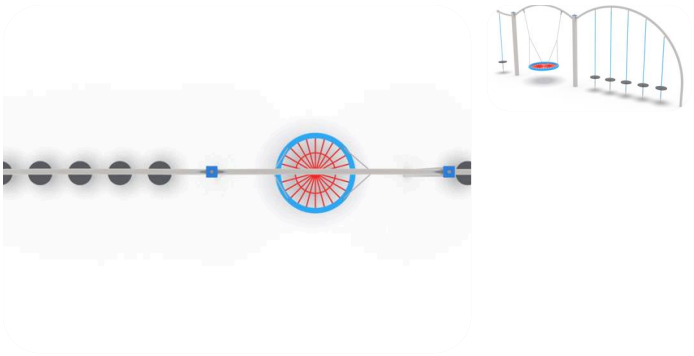

Safety zone L × W
Area to keep free around and under the equipment

Free fall height
WSU: highest fall distance for surfacing selection

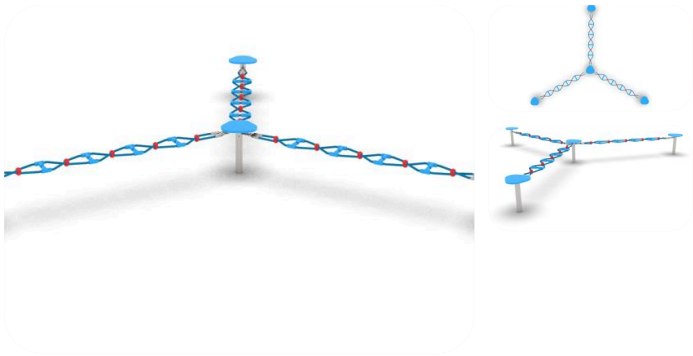

Age
Recommended age group where specified

Users
Number of simultaneous users where specified

Orientation summary only; it does not replace EN 1176 / EN 1177, national regulations or the installation instructions supplied with each product.
